June 8, 2015 MERS-CoV in South Korea

Middle East Respiratory Syndrome (MERS-CoV) is a viral respiratory illness first reported in Saudi Arabia in 2012. On May 20, 2015 South Korea reported its first confirmed case of MERS, since then numerous cases have been reported. All confirmed patients acquired the illness from coming in direct or indirect contact with MERS patients primarily in hospital settings. Symptoms of MERS include fever, cough, and shortness of breath.

The health and safety of our students is of the utmost importance to us and we too are monitoring the situation closely and consulting CDC, WHO, and State Department recommendations. As of June 8, 2015 they are not advising any travel restrictions, but do recommend you practice usual precautions such as:

- Wash your hands often with soap and water. If soap and water are not available, use an alcohol-based hand sanitizer.
- Avoid touching your eyes, nose, and mouth; germs spread this way.
- Avoid close contact with sick people.
- Be sure you are up-to-date with all of your shots and, if possible, see your healthcare provider at least 4-6 weeks prior to travel to get any additional shots.

Please reference the following resources for more information on MERS-CoV and MERS-CoV in South Korea:

Centers for Disease Control and Prevention
